

Washington

Regional objectives: *High disturbance; Nutrient management; Soil moisture; Agroforestry integration*

Production system: *Potatoes or other high-disturbance cropping systems*

Biochar producers: [Myno Biochar](#)

Potatoes and other high-disturbance systems in Washington producing specialty crops face challenges that limit their ability to reduce tillage and successfully integrate cover cropping. With the upcoming launch of Myno Biochar Corporation, locally available biochar offers a solution that improves soil organic carbon, aggregate stability, soil structure, water cycling, and yield. Biochar may also reduce the risk of unintended pesticide impacts from soil fumigants and other pesticide applications, while facilitating the success of other soil health practices in degraded soils by improving soil function in water-limited situations.
